

The Ever-Increasing World of Veterinary Care

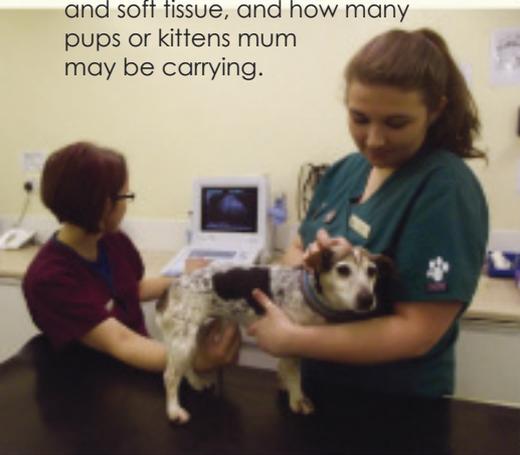

At Abbey Vets each day is different. It could be routine vaccinations or a cat with its head stuck in a tin, but whatever arises, you can be assured that our professional, dedicated team are here for your pets.

In the past, we had limited options in how we treated and cared for the animal community. Now with extensive scientific research and modern technology, this has opened up an advanced level of animal care, which almost matches that of human medicine.

Healthier and Longer Lives

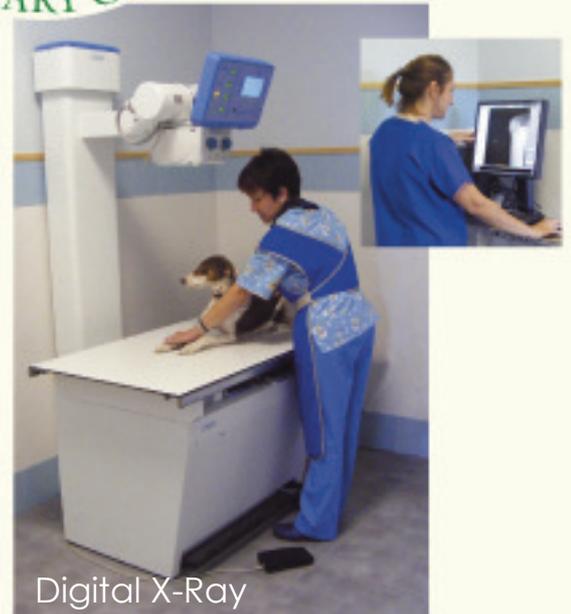

A combination of preventative healthcare, and the advancement of medical care, mean your pets can live much longer and healthier lives than before. We can diagnose and treat a wide range of conditions that may previously have been incurable. Vets also choose to develop their skills and specialise in areas such as ophthalmology (eyes) and cardiology (heart).

Ultrasound is non-invasive and shows us inside the patient's functioning body. The high frequency sound received, is converted into an image on the monitor, enabling us to see more detail of organs and soft tissue, and how many pups or kittens mum may be carrying.

In-House Laboratory

It might be necessary for us to do a blood or urine test on your pet, as these provide us with a wealth of information. Our laboratory has equipment for performing a wide range of diagnostic haematology, biochemistry and electrolyte tests, to provide accurate and rapid results. The quicker we diagnose any problems, the sooner treatment can begin. In elderly pets, a full blood-screening test can show the performance of kidneys, liver and thyroid glands. If required, we can suggest changes to their lifestyle and/or treatments, which may help to improve your pets' quality of life in their senior years.

Digital X-Ray

This provides rapid and excellent quality images of your pets' skeletal and soft tissue structure. It enables us to view injuries from accidents, arthritis, cruciate or ligament damage, or even the rather unusual objects that some pets ingest. It was reported that after x-raying one patient, a small teddy bear wearing an 'I Love You' t-shirt, was successfully removed from a dog's stomach..... on Valentines Day!

If you have any concerns regarding your pet's health, please call our friendly reception team to book an appointment with one of our vets.

Emergency Service

If you notice any of the following signs or suspect ingestion of either plant, please contact your vet immediately.

Excessive Drooling - Vomiting - Diarrhoea - Stomach Pain - Seizures

Poinsettias can also cause problems, but the level of toxicity is milder. However, extra care is required if these plants are in your home.

The white sap found in Poinsettias irritates the skin, mouth and throat, causing redness, itching and swelling. Puppies, kittens, and smaller breeds are more at risk, as their size and the amount of plant ingested, will determine the seriousness of poisoning.

If ingested it may cause: vomiting, diarrhoea, drooling and lip licking.

Again, always contact your vet immediately if your pet shows any of these signs.

A Kiss Under the Mistletoe

Ancient Druids and Norse Mythology tell stories of this seasonal plant, but unfortunately the truth for your pet....it's poisonous!

Mistletoe and berries, fresh or dried, contain substances that are toxic.

If ingested, this can cause severe intestinal upset, a sudden drop in blood pressure and breathing difficulties.

Sadly in some cases this can be fatal.

Holly/berries are also toxic, so either avoid having holly and mistletoe in your home, or keep these plants well out of reach from cats and dogs!

Exercise....

Love it or hate, we all need exercise to help keep us healthy and maintain a good weight, including our pets too! Exercise should suit the age, breed, lifestyle and medical condition of your pet.

Cats Infamously known for their sedate, sleepy life, but it is just as important to maintain their weight and encourage exercise. Some cats enjoy an outdoor life of chasing leaves and climbing trees, but others are more 'home birds'.

Tips to encourage exercise

Cats love empty boxes! A variety of shapes and sizes with holes cut out, will create a good 'leaping and jumping through' exercise area.

Lightly screwed up tissue paper creates a lovely noise when chased round the room.

Tiered climbing levels and scratching posts provide exercise and entertainment for cats.

Roll a small cardboard tube across the floor for chasing.

Ribbon, string or shoelace tied to a stick and gently waved, encourages play. However, please be aware that these play items can be choking hazards. If swallowed, they could cause a blockage in the throat or intestines. Pack away after play, and supervise your kitten or cat during exercise time.

Dogs When the lead appears there is usually no lack of enthusiasm on their part for walks! Although at times it may be wet, windy and cold, and staying in the warm is more enticing, as pet owners we do have a responsibility to provide regular exercise for our dogs. In the great outdoors, your dog can enjoy investigating the exciting scents, generally have fun, meet other canine friends and play ball. Please be careful throwing sticks for play. Sadly we have seen some horrific injuries, where they have become lodged in the mouth or throat, ending up with lengthy operations to remove stick and splinters!

Have fun and enjoy exercising your pet. If you have any questions please do not hesitate to call us. Our free nurse clinics, offer friendly and informative advice on suitable exercise, nutrition and provide regular weigh-ins to keep a check on your pet's weight.

Buster Collars

If your pet has stitches, a wound, skin problem, bandage or even a plaster cast, we may recommend that your cat or dog wears a buster collar. Without one, they could reach the area (especially when you are not looking), which needs to be protected against scratching feet, licking tongues and nibbling teeth. It has been known for stitches to be removed, plaster casts demolished, skin licked raw and bacteria spread to cause infection. It is important to keep the area dry and as germ free as possible to aid speedy recovery, and that is where the buster collar helps! Some pets cope reasonably well with the plastic cone, while for others it can be a stressful, disorientating time, and for the owner too! Recently though, friendlier options have become available.

Lucy was admitted for two small lump removals, which involved stitches to her elbow area and back, both easily reached to lick and nibble! She is a little nervous at times, so it was decided that an inflatable neck collar might be more beneficial to her temperament, and it certainly was! Lucy was happy to wear the collar all day and actually used it as a pillow at night!

Please ask a member of our nurse team to discuss a suitable collar for your pet.

Four Top Tips for Firework Fright

1. Create a safe haven for your dog or cat in one room of your house.
2. Keep your pets indoors.
3. NEVER punish or scold a fearful pet. Playing a game during the whizzes and bangs can encourage confidence.
4. Use a pheromone diffuser or spray.

Preparing in advance to combat Firework Fright is best. We are here with plenty of help for nervous pets and advice for owners, so please call us now to discuss the appropriate therapy for your pet.
